### 0) General information about « missings » or jump rules

For all tasks assessed via Psytools, only completed runs will be shown in the main data base. Data points without a value therefore have not been skipped or missed. In fact, jump rules have been implemented to allow for a shortened assessment where applicable.

For example, if the parent indicates to be a non-drinker or to drink almost never in the first question, the MAST questionnaire ends as all following MAST questions refer to consequences of drinking. The variables will be left blank. For creating summary variables, those “missings” or rather blank cells are taken into account, meaning the missing values will be counted as zeros. However, it was decided not to replace all “missings” caused by jump rules with zeros so the user can distinguish between questions that have actually been answered and questions where a jump rules has been applied.

The following jump rules have been applied, please see further chapters for variable and value labels:
